

Mechanical Press Concept

The embodiment of long service life,
high availability and low maintenance costs

Mechanical fineblanking presses are particularly well suited for processing materials with a thickness of up to 12 mm using total press forces of up to a maximum of 2500 kN for manufacturing parts.

Our mechanical fineblanking presses have a fixed ram movement with accurately positioned upper and lower reversal points. Other features of this press series are their ability to use tools with moving or fixed ram plus simple maintenance and low operating costs.
